

Information Management (Open Framework)

OPENframework is ICLs vision to develop fully integrated information systems. It is based on Open Systems and distributed, object oriented computing. OPENframework is a methodology to provide an information systems architecture, to plan information technology strategies and to effect multivendor integration throughout an enterprise. The OPENframework systems architecture is explained in this series of books, each one concentrating on one aspect in particular. Individually each book provides a study of the major technology trends and offers advice and guidance for decision making. Together, they provide a set of analysis tools for designing information systems. The volumes are colour coded for easy identification. One of the red books which discuss elements, this volume looks at information management.

Integrated Content Repository - Open Framework, data governance MIKE2.0 is an open source methodology for enterprise information management that provides a framework for information development.
