

From Keyword Search to Exploration: Designing Future Search Interfaces for the Web (Foundations and Trends(r) in Web Science)

Web search has already transformed the way people find travel information, cope with health problems, explore their family history, or discover their cultural heritage. The enterprising researchers and designers who strive to support the ever-rising expectations are developing finer taxonomies of usages, richer cognitive models of information seeking, and more effective evaluation strategies. This carefully structured monograph reports on these efforts and the variety of interface innovations that surround novel visualizations of search results. It lays out the territory for researchers and designers who wish to support the growing number of users who are eager to explore freely and discover successfully.
